# Tauri

The following guide will cover the basics for generating a new [Tauri](#) app using both SvelteKit and Skeleton.

[Tauri](#) is a toolkit that helps developers make applications for the major desktop platforms - using virtually any frontend framework in existence. The core is built with Rust, and the CLI leverages Node.js making Tauri a genuinely polyglot approach to creating and maintaining great apps.

## Prerequisites

Before you begin, make sure to install all required Rust language and system dependencies per the guide below.

Tauri Prerequisites Guide [↗](#)

## Video Guide Optional

For visual learners, the following video will guide you through the process of integrating Tauri and SvelteKit. You can then follow these instructions to [manually add Skeleton](#) to your project.

SvelteKit and Tauri: Blazing-Fast Desktop Applications
